Chapter 1. Introduction

Overview

Harness.io manages the full lifecycle of the CI/CD (Continuous Integration/Continuous Deployment) process. You can define and automate your build, test, and deployment pipelines using easy-to-configure YAML files, and the pipelines can also be version-controlled, making updates and changes simpler. Harness supports parallel execution of jobs, allowing you to run builds, tests, and deployments simultaneously.

Access and Roles

Go to **MyAccess** (go/myaccess) to request the necessary roles.

- To use Harness: **PP_xyz_operator**
- To deploy to Production: **PP_xyz_Deployment** (you must also have current **SRE IPCF Training**, previously known as "Think Twice"),

Requests go to your manager for approval and may take 40 minutes to sync. For information about other roles, see **Harness.io Roles in MyAccess**.

To log in to Harness, go **here**, click the "Single sign-on" button, and enter your PayPal email address.

Chapter 2. Onboard Your Application

Console (Raptor/Kraken/Node.js)

Make sure you have requested the required roles and that you have completed **SRE IPCF Training**.

These instructions are for a **new** application. If your application was already onboarded to Harness, see **Harness Pipeline Upgrade**.

1. Go to **Console**.
2. Navigate to your application by clicking "Applications" in the left nav and then finding it under "Recent" or by using Search.
